

Saving lives and **enhancing patient care**
through elegant healthcare solutions.

The Vista Solution™

Continuous patient monitoring.
Anytime, anywhere.

The Vista Solution™ platform changes the way we think about health care and life-saving intervention with continuous, real-time monitoring of eight measurements for all of your patients.

VistaCare™ In The Hospital

Continuous monitoring improves patient oversight beyond the routine spot check and enables hospital staff to provide better care and faster intervention. Caregivers can assess real-time patient status, as well as review vital sign trends. These trends can drive predictive analytics and early detection of patient decline, allowing caregivers to intervene with treatment sometimes days in advance of a serious event.

The wireless biosensor gives patients more freedom within their room and comfort while they rest. Patients have the peace of mind that their health is being monitored while they recover comfortably; free from wires and constant interruptions.

VistaMobile™ At Home

Keeping the connection alive after the patient has left the hospital allows insight into how they are recovering over the days following discharge. Caregivers can identify patients who need follow-up or additional care—intervening before decline becomes severe. Such interventions may improve recovery time and reduce hospital readmissions.

Patients rest easiest in the comfort of their own home surrounded by loved ones who provide support—this may lead to faster recovery, increased physical activity, and an increase in satisfaction. Keeping patients healthy at home may result in cost savings from a reduction in lab orders and fewer consultation requests.

Seamless Connectivity

Vista Solution™ Platform is an FDA-cleared, end-to-end solution that enables constant and unprecedented insight into patient health.

Creating a single, connected system that brings together a wireless biosensor, secure cloud storage, analytics and convenient, web-enabled interfaces improves caregiver efficiency. Remote access at your fingertips will expand care beyond the hospital walls and transform the experience for both patients and caregivers.

Unparalleled **Biosensor** Technology

The **VitalPatch®** Biosensor is as smart as it is compact.

The VitalPatch wearable biosensor is the foundation of the Vista Solution Platform. The lightweight, comfortable design ensures compliance for monitoring around the clock and across care settings. It is worn discretely on the upper chest of the patient and monitors eight biometric measurements. Data continuously streams via BTLE to a mobile device or a relay; caregivers can stay connected to patients when they need it most.

- **Truly Wireless**
- **Lightweight & Comfortable**
- **Clinical-Grade Accuracy**
- **Waterproof Adhesive**
- **Single Patient Use (120 hours)**
- **Fully Disposable**

VistaPoint™ Application

VistaCenter™ Application

Critical oversight between spot checks with continuous patient monitoring enables real-time awareness and the ability to respond quickly when needed.

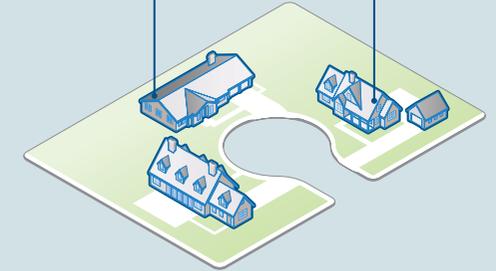

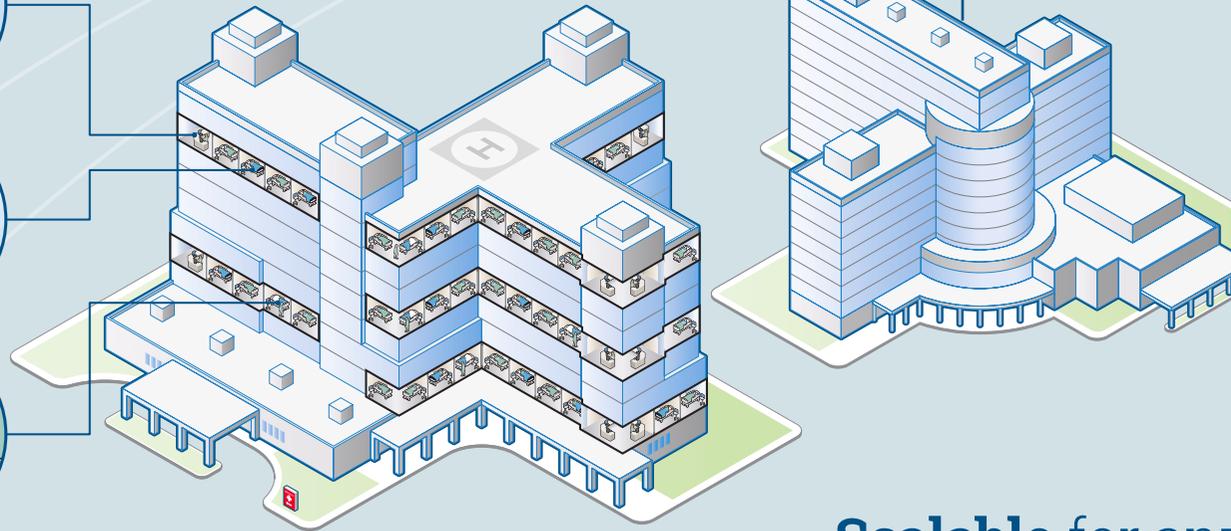

With true connectivity, patients can rest, recover, and freely move around the room without having to remove monitoring wires and devices.

Ability to monitor multiple units and outpatient care from one remote location.

The ability to continue to monitor at home means that patients leave the hospital sooner with less risk of readmission.

Scalable for any Care Environment

The **VistaCenter™** application allows you to monitor multiple patients simultaneously for early warning signs, fall detection and care prioritization.

Patients from any care environment, such as a hospital general ward, skilled nursing facility, or a patient's home, can be monitored remotely from the VistaCenter application.

High quality care that isn't tied to the hospital bed.

Trust VitalConnect
with real-time monitoring,
so patients can trust you
with their lives.

The Vista Solution is FDA-cleared for hospital and home use. It is intended for use on general care patients who are 18 years of age or older as a general patient monitor, to provide physiological information. The data are intended for use by healthcare professionals as an aid to diagnosis and treatment. The device is not intended for use on critical care patients.
